# G.D. Goenka Public School, Srinagar

**Subject: General Knowledge** **Grade- 2** **Date: 16-09-2021**

**Topic: Inside Our Body** **Exercise No. 22** **Week: 08**

**Aspect: Supporting Content**

**Note: This pdf is not to be printed.**

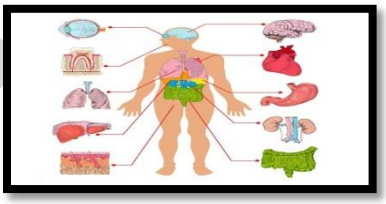
**Objectives: Learners will be able to:**

- **understand the functions of internal organs.**
- **identify internal organs.**

Every living thing is made up of cells. As a wall is made of bricks, a class is made of students or a book is made of pages. Similarly, our body is made of cells. A group of cells make a tissue. A group of tissues make an organ. Organs are divided into two groups:

1. Internal organs 2. External organs

1. ***External organs:*** are the body parts which we can see outside. For example eyes, nose, ears, hands, legs, mouth, fingers etc.



2. ***Internal organs:*** are the body parts which cannot be seen outside. They are located inside our body. For example brain, heart, stomach, bones, lungs and kidneys.

   1. ***Brain:*** Brain is located within our skull. It controls all organs and body parts. It helps us in thinking. It helps us in solving difficult problems. It helps us in memorizing different things like important dates, names of people, places etc.

   2. ***Heart:*** Heart pumps blood inside our body. It is made up of muscles. It is located in the middle of the chest slightly to the left. It is about the size of a fist.

   3. ***Kidneys:*** Kidneys are located in our lower back. They are two in number. Kidneys are busy organs. They are like washing machines for the blood in the body. They remove all the waste from the body.
